Professional Summary

Software Engineer with extensive experience designing and delivering scalable backend systems and real-time platforms. Proven success across 10+ professional projects using Python, Go, and modern distributed technologies.

Work Experience

Top - 2023-Present

B2C Tourism Platform

- Designed and built a large-scale **tourism platform (3M+ users, 9+ B2B partners)** with **multi-gateway payment** orchestration and asynchronous, **cached** processing to reduce latency and database load.

Real-Time User Analytics System

- Built a high-throughput analytics system** with a visual **Journey Builder** to automate personalized user flows, engagement triggers, and A/B tests; powered by FastAPI, ClickHouse, and RabbitMQ.

Messaging System

- Built a priority-managed messaging system (SMS & Push) using **Redis Streams** for efficient, real-time message queuing.

Real-Time Taxi POS Backend

- Developed a **WebSocket-powered** system for real-time **POS payments** and **live location streaming**.

Mock Server

- Architected a mock server with FastAPI to support user-defined APIs and dynamic Jinja2 response generation.

AI-Powered Supermarket Agent

- Built an automated shopping assistant for WhatsApp, enabling users to place orders via voice or text, with the AI handling product search, cart management, and order creation.

Atishahr - 2022-2023

SIB Ticket System

- Optimized a key reporting endpoint, achieving a **20x performance** improvement and eliminating slowdowns under high load.
- Contributed to the project's second version using FastAPI, implementing **asynchronous features** to handle increased system load.

Mehr Pars - 2021-2022

Organizational Resource Management System

- Developed **a migration module using OOP**, enabling seamless transitions from legacy project management systems to the Rainesh platform, improving customer satisfaction.

Comprehensive Warehouse System

- Developed a **fuzzy reverse proxy** module for a large-scale warehouse system, simulating backend conditions under high load to improve frontend stability and user experience.

Open Source

- PyBotNet**, A Python remote control framework with Telegram integration.
- Muxr**, A Golang WebSocket multiplexing library for efficient real-time communications.
- IP**, A Golang TCP server that returning the client's IP and country in multiple formats.
- PriceBot**, A Golang Telegram bot that provides real-time updates for currency exchange rates, gold prices, and cryptocurrency values in Iran's market.
- IHateYou** Token, A minimalist ERC-20 social token on the Polygon network, designed as an experiment in on-chain communication with a 100% fair launch model

Technical Skills:

- Python:** Proficient in **OOP**, **decorators**, **Async** programming and **testing**
- Go:** **Goroutine**, **channel**, **concurrency** patterns, and **testing**
- Web Development:** **FastAPI** and **Echo**
- Blockchain / Smart Contracts:** **Solidity** and **web3.py**
- Databases:** **PostgreSQL**, **ClickHouse**, and **Redis**
- Systems:** **Linux**-based administration
- Security:** Familiar with core concepts and best practices
- Version Control:** **Git** for collaborative development and **CI/CD** pipelines

Soft Skills

- Team Leadership:** Led a 3-member engineering team, guiding system design, reviewing merge requests, and ensuring code quality and delivery consistency.
- Collaboration & Communication:** Fostered effective teamwork through clear documentation, peer mentoring, and structured design discussions.
